

ADVANCE

CADD

COMMANDS

EXPERIMENT No. :-

ROLL No. :-

DATE :-

## ADVANCE AUTO CAD COMMANDS

AIM :- ~~To perform Autocad commands :- (Part 2)~~

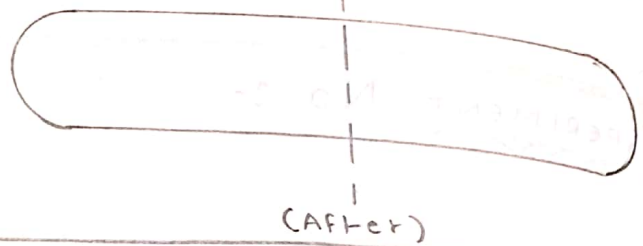

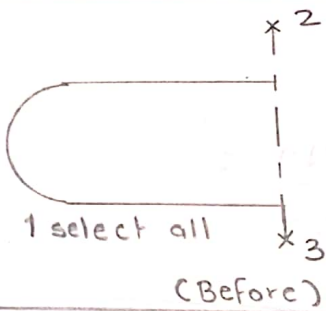

**Use computer aided drafting approach to apply modifications on 2D shapes.**

### THEORY :-

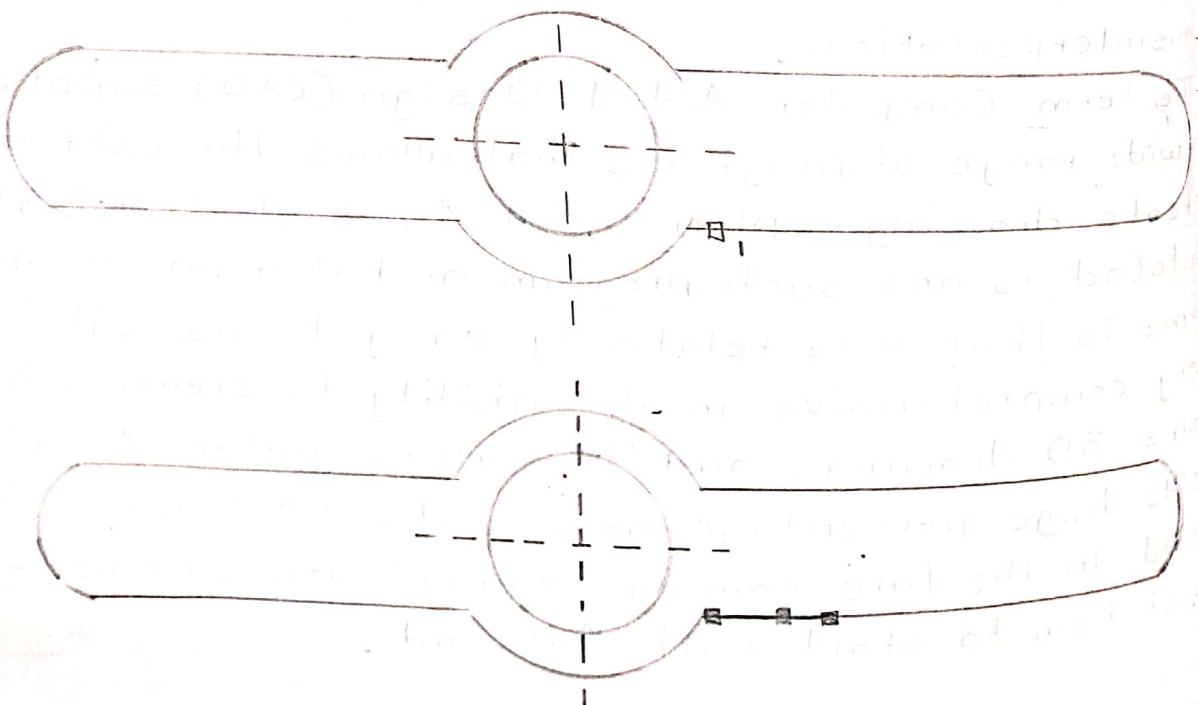

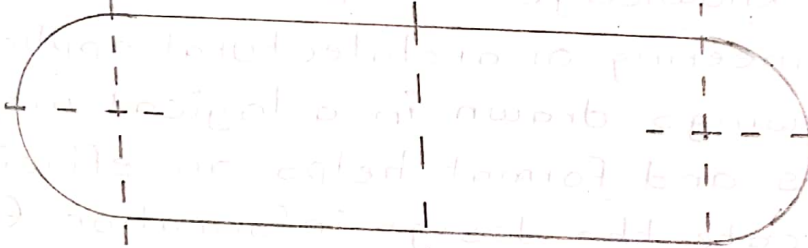

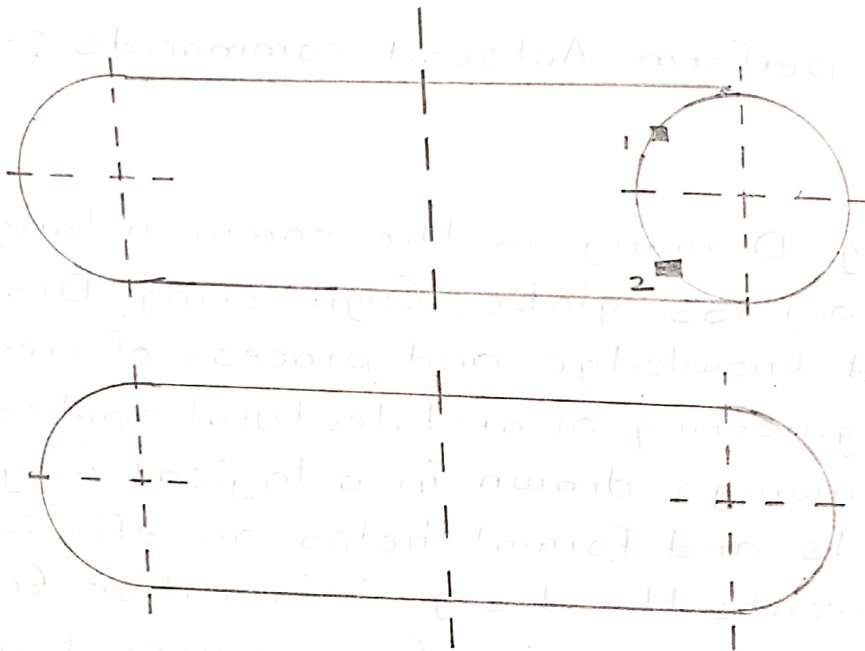

Engineering Drawing is the common language of engineers across globe. Engineering Drawing provide the required knowledge and process of creating drawings for any engineering or architectural application. Engineering Drawings drawn in a logical way following the standards and format helps an efficient way to communicate the design information. Engineering drawing describes a specific component in a way that the viewer of the drawing understands without misinterpretation.

The term Computer Aided Design (CAD) supplies to a wide range of programs that allows the user to a create drawings, plan and designs electronically. AutoCad is one such program and it main claim to fame is that it is relatively easy to use, it is very comprehensive in its ability to create 2D and some 3D drawings and it is very popular. AutoCad holds huge percentage among the CAD users in the world. In the fare coming segment you will be learning about how to start with AutoCad.

## MIRROR COMMAND

## TRIM COMMAND

## EXPLODE COMMAND

## Advance Auto Cad Command

### 1) Mirror Command :- (Mirror ↓)

Mirror command is useful to create symmetric object easier and quicker. You can create objects that represent half of a drawing, select it and mirror it across a symmetry line to create the other half. You can either retain or erase the original object during mirror operation.

### 2) Text Command :- (Text ↓)

Text command is used to create a single-line text objects.

### ii) MText Command :- (Mtext ↓)

Mtext command is used to create a multiline text object.

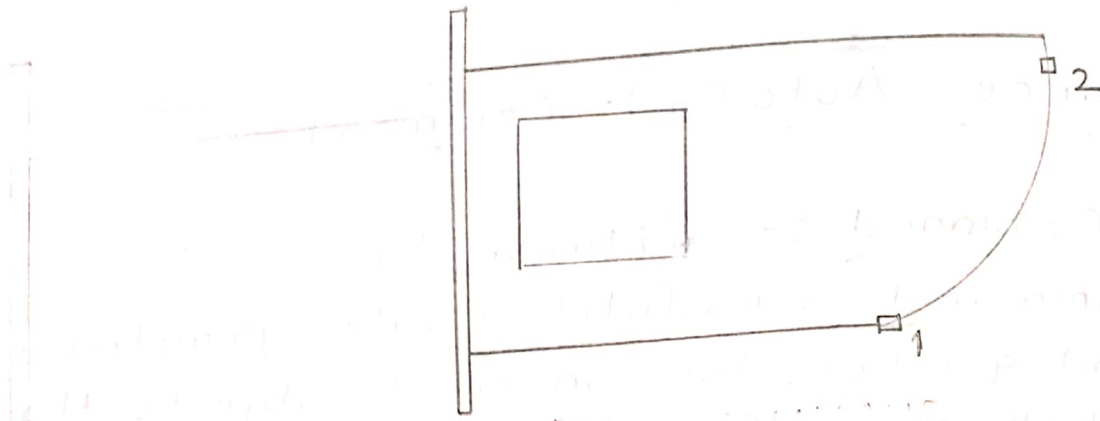

### 3) Trim Command :- (Trim ↓)

Trim command is used to delete the unwanted part of an object.

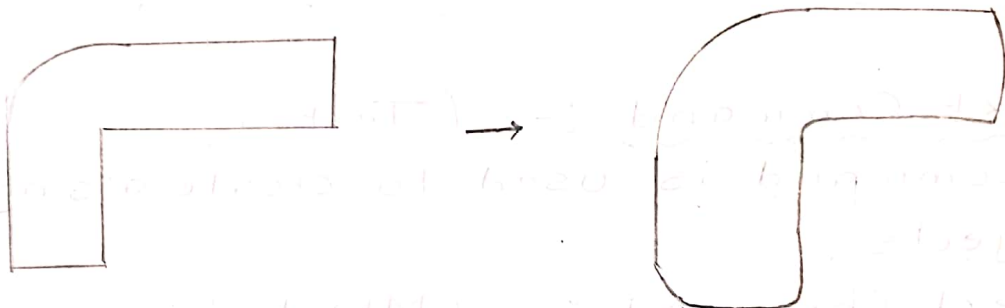

### 4) Explode Command :- (Explode ↓)

Explode is an important command which helps to break an objects like blocks, polylines and regions into multiple sub components. Generally explode command is used to break a grouped object into sub components which can be controlled individually.

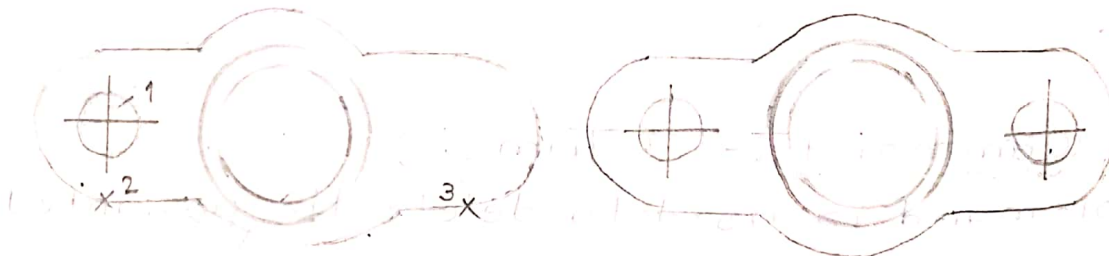

## FILLET COMMAND

## CHAMFER COMMAND

## COPY COMMAND

## EXTEND COMMAND

#### 5) Fillet Command :- (Fillet ↵)

Fillet command is used to make curves by removing sharp corners created by two entities. A round or fillet is an arc that is created tangent between two 2D objects. Fillet can be created between two objects of the same or different types arcs, circle, ellipse, elliptical arcs, lines and splines.

#### 6) Chamfer Command :- (Chamfer ↵)

Chamfer command is used to create bevels at the corner of the two 2D objects or the adjacent faces of 3D solid. A bevel or chamfer can be defined by selecting two objects of the same or different types like lines, polylines, rays and xline.

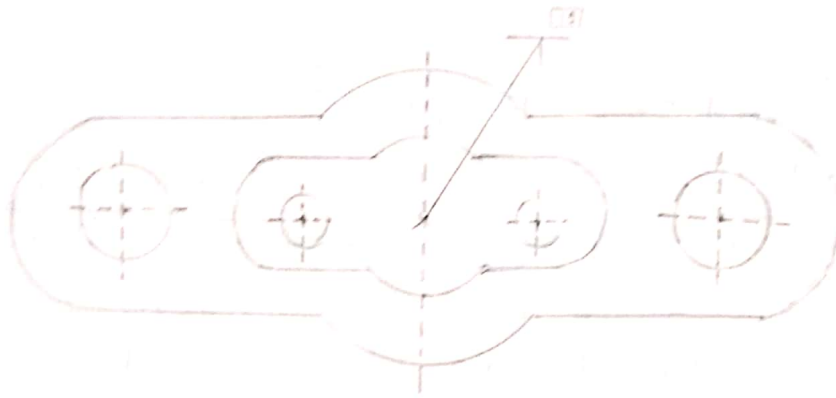

#### 7) Copy Command :- (Copy ↵)

Copy command is used to create a copy of any object and locate in a specified distance in a specified direction. With the COPYMODE system variable, you can control whether multiple copies are created automatically.

#### 8) Extend Command :- (Extend ↵)

Extend command is used to extend the object to meet the edges of other objects.

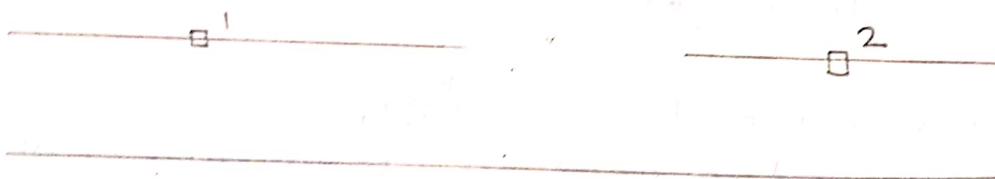

## STRETCH COMMAND

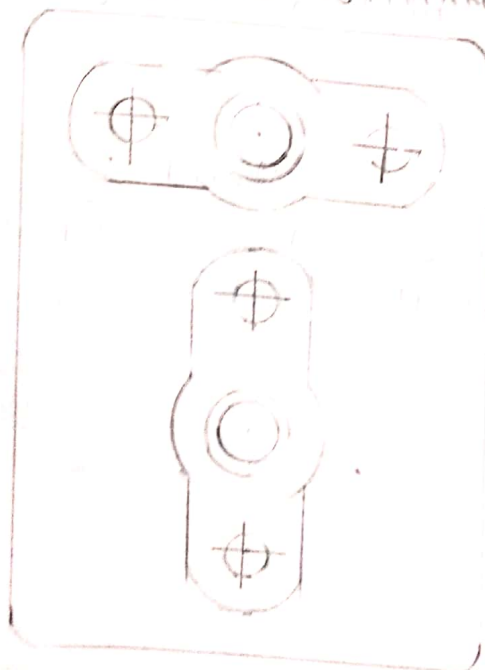

## BREAK COMMAND

## JOIN COMMAND

## ROTATE COMMAND

9) Stretch Command :- (Stretch ↵)

Stretch command is used to elongate the selected object along the stretched direction. You need to select the objects using cross selection for stretching them.

10) Break Command :- (Break ↵)

Break command is used to delete a portion of an object specified by a starting point and ending point. Line, arc, circles, polyline, ellipse and several other objects can be split into two objects.

11) Join Command :- (Join ↵)

Join command is used to join the endpoints of linear and curved objects to create a single object.

12) Rotate Command :- (Rotate ↵)

Rotate Command is used to rotate the objects around a base point at specified angle.

\* Conclusion :- In this we ~~got to learn~~ how to use the advance commands of Auto Cad like Extend command, copy command, Explode Command, Trim command etc.
